HIGH ACCIDENT INTERSECTIONS REPORT

USING DATA FOR 1994, 1995 AND 1996 (3 YEARS)

MASSACHUSETTS HIGHWAY DEPT. • TRAFFIC OPERATIONS • SAFETY MANAGEMENT UNIT

1999

Introduction

This report was prepared by MassHighway to summarize motor vehicle police and operator accident data received from the Registry of Motor Vehicles to attempt to identify intersections with the highest frequency of accidents throughout the Commonwealth. This listing is in two parts:

Part I - Sorted by Weighted Ranking

Part II - Sorted Alphabetically by City/Town, then by Weighted Ranking

Methodology

Accident data for 1994, 1995 and 1996 were first matched with the roadway inventory file maintained by the Department's Bureau of Transportation Planning & Development on a mainframe computer. If the reported accident location was at an intersection (two streets or route numbers reported as accident location), and if both street names or route numbers matched with corresponding streets or routes in the roadway inventory file, these accidents were potentially eligible to be included in this listing. A high proportion of accidents either did not occur at an intersection, or the nearest intersecting street name was not reported. For these reasons, and also because of frequent inconsistencies in the spelling of street names, inconsistent abbreviations, unrecognized streets, and other data problems, only about 40% of all accidents were able to be utilized as the input data set for the high accident location summarization program.

The 1000 locations that resulted from the summarization program were reviewed and edited by Central Transportation Planning Staff (CTPS) to identify instances of the same location appearing more than once (due to rotaries, use of route number instead of street name, intersections with the cross street having a different name on each side of the intersection, etc.). Records where the location could not be determined (e.g. I-93 at Central Artery) were excluded. The resulting list consisted of 927 out of the original 1000 locations.

Weighting

Weights were assigned to give greater importance to more serious accidents during the ranking process. Fatal accidents were given a weight

of 10, injury accidents a weight of 5, and property damage only accidents a weight of 1. The weighting is not intended to be a measure of the actual economic or social costs associated with accidents of each severity, but merely a way of incorporating the degree of accident severity in the rankings.

A single fatal accident involving multiple fatalities at an intersection could potentially cause a particular location to move to the top of the list one year, then fall off the list in subsequent years. By using three years of accident data, this effect is minimized.

Tier Groupings

There is a wide spectrum between the locations with the highest rankings and those with the lowest. In order to break up this spectrum, six tier ranges were developed as follows:

<u>Tier</u>	<u>Weighted Average Range</u>	<u>No. of Locations</u>
1	400-471	4
2	300-399	9
3	200-299	35
4	150-199	74
5	100-149	226
6	64-99	579

Within each tier, a tier rank (ranking within that tier) is indicated.

Accident Frequency v. Accident Rates

It should be noted that these high accident location listings are based on frequency of reported accidents, not on accident rates. Therefore, it should not be surprising that many of the locations listed are on roadways with high average annual daily traffic. High volume interchanges on Interstate highways and locations in the Eastern part of the Commonwealth where traffic volumes are high can be expected to predominate the list, and this in fact is what occurs.

A procedure that adjusted intersections for traffic volume prior to developing rankings would serve to prioritize locations on the basis of accident rates rather than the mere frequency of accidents. Such a procedure is an objective of an improved Crash Records System.

Explanation of Columns

The following is an explanation of columns in the High Accident Locations listing for 1994-1996:

Rank - Overall rank of location on entire list; 1 indicates the location with the highest reported accident frequency; the lowest rank on the list is 927.

City Num - City/Town number; 001 = Abington; 351 = Yarmouth

City/Town - City/Town name

Rte. 1 - Route number corresponding to the first street of the accident location. If a road carries more than one route number, the number of the highest hierarchy (Interstate/U.S./State) or lowest number within the same hierarchy is used.

Street - First street of the accident location. Note that the summarization process may transpose the two street names in order to achieve consistency prior to aggregation (e.g. Route 1 at Walnut Street and Walnut Street at Route 1 both appear as Route 1 at Walnut Street).

Rte. 2 - Route number corresponding to the second street of the accident location.

Intersecting Street - Second street of the accident location.

Total Incidents - Three year total of all fatal, injury and property damage only accidents/crashes/incidents reported as occurring at that location.

Property Damage - Three year total of all property damage only accidents.
Injury - Three year total of all accidents/crashes/incidents involving personal injury.

Fatality - Three year total of all fatal accidents.

Number Injured - Number of persons injured in all accidents/crashes/incidents during the three year period.

Number of Fatalities - Number of persons killed in all accidents/crashes/incidents during the three year period.

Wt. Avg. - Weighted Average using number of accidents weighted by accident severity (see Weighting paragraph above).

Tier - See Tier Grouping paragraph above.

Tier Rank - See Tier Grouping paragraph above.

Future Work in Progress

The 1994-1996 listing was prepared using a mainframe computer and "legacy" COBOL programs. Efforts are underway to utilize new GIS-based computer tools and new procedures to produce an improved listing using data for more recent years. Separate efforts are also underway to try to obtain improved crash location data at the source, as part of the development of an improved Crash Records System at the Registry of Motor Vehicles and at MassHighway.

Comparability with Past and Future High Accident Location Listings

Due to editing procedures used in this 1994-1996 listing (which were not performed in listings for prior years), this list may not be directly comparable with similar listings for past years. Some duplicate locations when combined in this list have a higher weighted average (and lower rank) than do the same locations on previous listings.

Who to Contact for More Information

Further information may be obtained from the Safety Management Unit, MassHighway, 10 Park Plaza, Room 7210, Boston, MA 02116 telephone (617) 973-8390.

Errata

An effort is being made to document errors in the attached listing when they are discovered, in an ongoing fashion. As of Jan. 25, 1999, the following errors have been discovered:

Rank #524, Braintree, I-93 at Granite St. is the same location as Rank #812, Braintree, Granite St. at I-93. If combined, the weighted average becomes $84+68 = 152$, which moves this location from Tier 5 to Tier 4 (new rank 113 Statewide).
